Challenge Description

The Problem (Status Quo)

Header: Traditional Voice Messaging

* High bandwidth consumption.
* Severe delivery delays on unstable links.

The Challenge/Our Solution

Header: Semantic Transmission

* Edge AI local meaning extraction.
* Smaller payload containing semantic information.
* Capable of working in unstable network conditions.

Validated Requirements

Category	Validated requirements
Communication	Asynchronous message sending
	Standardized semantic payload with transcript and metadata
	Delivery-state feedback
	Measurable bandwidth reduction vs. raw audio transmission
User Interface	Explicit start/stop recording controls
	Dynamic transcript display after processing
	Real-time status feedback
	Graceful, non-disruptive error handling during demos
AI Model	Model runs locally; retry path for capture/transcription failures; transcript shown before transmission; raw audio discarded after transcription; low end-to-end latency
Validation concept	Peer Reviews & Checklist Comparison

Outcome of the Market Survey

AI PROCESSING: Whisper large-v3

- High Accuracy STT & Native Portuguese Support.
- 100% Offline Capable (Critical for live demos)
- Free & Open-Source

COMMUNICATION TRANSPORT: MQTT

- Minimal network overhead & very low latency
- Pub/Sub Broker Paradigm
- Asynchronous delivery (Decouples TX from RX)

TEST 2
Integration with Receiver (May 22)
System Optimization (May 25-29)
Project Finalization
D8: Final Report
FINAL SYSTEM & DEMO (June 3)

Measures of Effectiveness and Performance

WER

Semantic Accuracy

- Evaluates the system's effectiveness in capturing the users's correct intent.
- If the WER is high, the main objective semantic communication) fails.

Delivery Reliability

- The percentage of payload that are successfully published to the Broker out of the total number of attempts.
- The percentage of payloads that are compliant with the schema chosen to format the payload (JSON).

End-to-End Latency

[MQTT Delivery Reliability]

- The total time measured from the moment the user finishes speaking until the formatted payload is sent.
- The risk report stipulates that the model's latency cannot exceed the defined limit.

Risk Management

PoO \ Impact	Low	Medium	High
High			High Latency From AI Model
Medium		Insufficient Audio Quality	MQTT Communications Failures
Low		Resource Exhaustion During Demos	HW Failures

PoO - Probability of Occurence

Internal Evaluation

End of Semester Plan

Thank You for Your Attention!
